# Removing Aluminum Panel Forms

## Description

Team members were using crowbars or a chisel/hammer combination to remove aluminum panel forms from concrete box culverts and manholes after they were finished. The new tool that was developed helps team members remove aluminum panel forms more safely.

## Project Initiation

Billy was looking for a tool that was easier to use that had multiple leverage points.

## Project Benefits

The tool is much easier on team members from an ergonomic standpoint (arms/shoulders). The danger of crushing a finger or hand has also been eliminated (hammer/chisel).
