Wall Panel Support

Description

Supports brackets were designed and built to prevent form walls from accidentally falling over while form is being erected. They are simply placed over wall sections providing support in both directions.

Project Initiation

After viewing an accident report in which an employee was injured from a form section that had fallen on the employee and realizing we use similar forms and the potential of a related accident was very possible. I wanted to come up with a simple and user friendly way to support these sections while they were being secured together.

Project Benefits

The plant has eliminated the potential of the wall section falling while the form is being assembled. The brackets are easy to use with very minimal training and have proven to be very safe and effective.
